Important Safeguards and Warnings

Please read the following safeguards and warnings carefully before using the product in order to avoid damages losses and body injuries.

Electrical Safety Information

- ✧ This product uses 48V POE as power source. Connection to a different power source than those specified may result in improper operation, damage to the equipment or pose a fire hazard if the limitations are not followed.
- ✧ There are no operator serviceable parts inside this equipment. Service should be provided only by a qualified service technician.
- ✧ Do not use this product in location that can be submerged by water.
- ✧ Do not install this product during an electrical storm. There may be a risk of electric shock from lightning.

Notice Information

- All the designs, software and instructions here are subject to change without prior written notice.
- We would not be responsible for any damages and losses caused by improper operations or installation. Do not allow non-authorized or unqualified personnel with any kind of intervention to the product.
- All trademarks and registered trademarks are the properties of their respective owners.
- Please visit our website www.rhinoco.com.au for more information.

Introduction

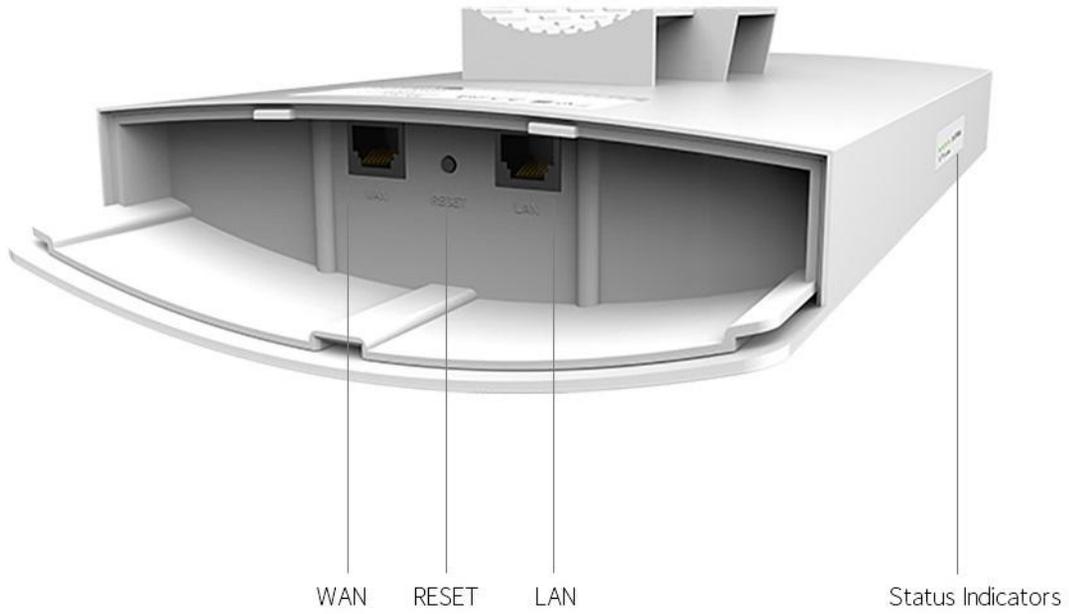

Longevity LGAP200 is designed for long distance transmission of IP packets which is commonly used in PC network and network cameras. It has four working modes: Access Point, Bridge, Repeater and Router.

Package Contents

Confirm that the following parts are included:

Device Layout

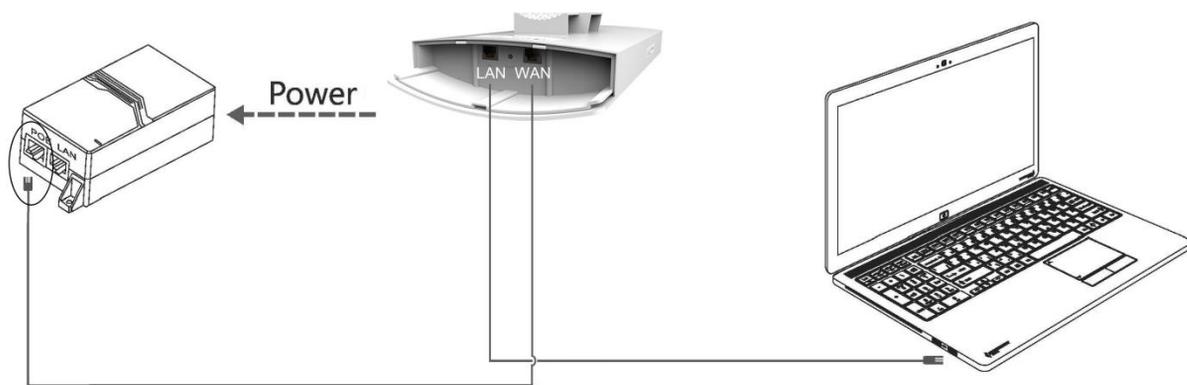

Installation - Pole mounting

1. Install the stainless straps to the back of the device as shown.
2. Align the device on the pole and then fasten the straps.

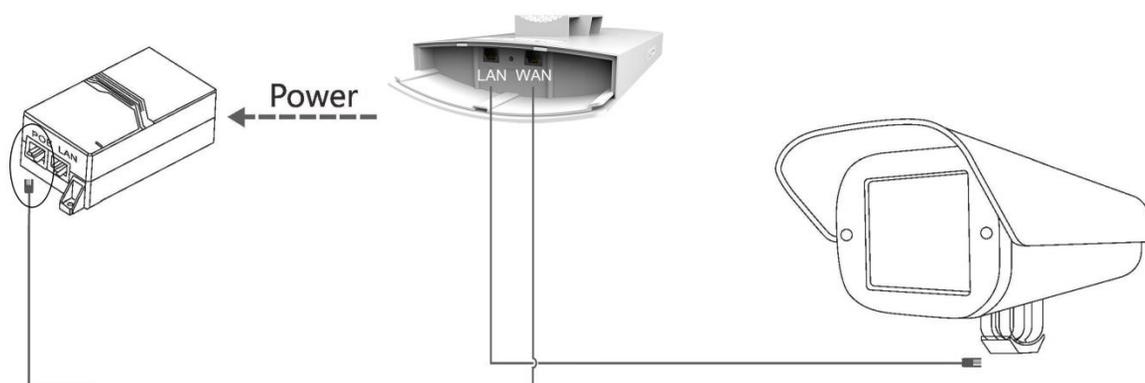

Connection Diagram

1. Connect the power cord to the power connector on the back of the POE injector. Plug the other end of the power cord into an AC (mains) power outlet.
2. Connect the LAN port of the Longevity LGAP200 to your PC/Laptop or IP camera's Ethernet port with an Ethernet cable.
3. Connect the WAN port of the Longevity LGAP200 to the POE port of the POE injector with an Ethernet cable.

Connect to PC/Laptop

Connect to an IP camera

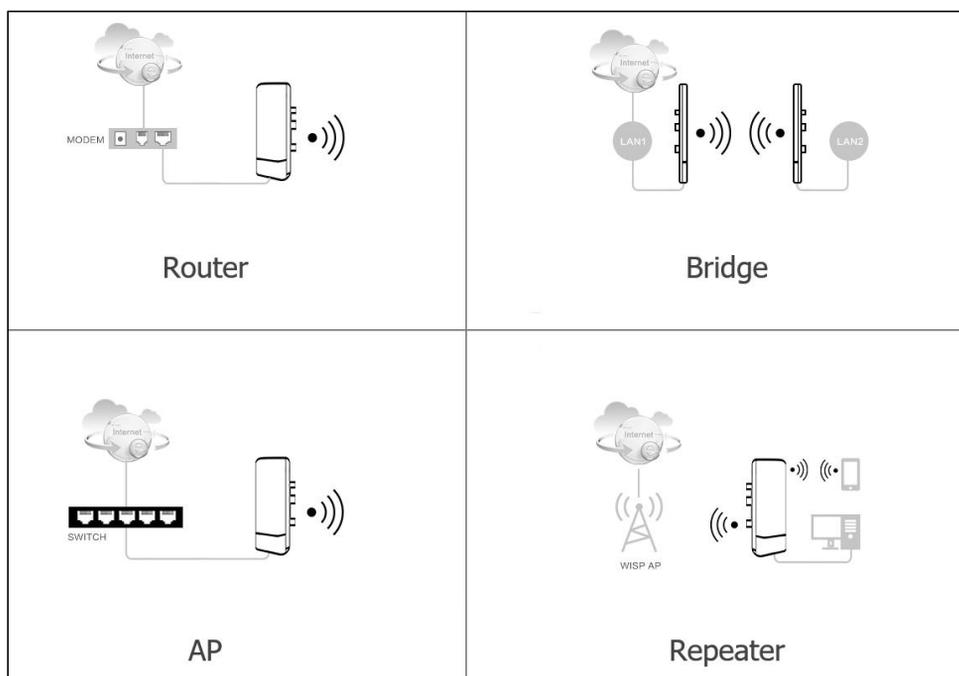

Device Setup

1. Connect the device as shown above.
2. Change the IP address of your PC/Laptop to 192.168.10.199. (Other number except 192.168.10.1 may also work)
3. The default IP address of the device is 192.168.10.1. Open your web browser and type 192.168.10.1 into the address bar of your browser and press <ENTER>.

Note: If the browser is not working properly, clear the cache and cookies data of the browser. Restart the browser and try again. (Internet Explorer or Microsoft Edge is recommended)

4. Input the password and click **Login**. The default password is **admin**.
5. Click the **Wizard** icon on the left panel to select operating mode.

Longevity LGAP200 has 4 working modes: Router, **Bridge**, **Access Point (AP)** and **Repeater**.

Mode	Function
Bridge	Connect two network segments wirelessly
AP (Access Point)	When connects to a wired router or switch with internet access, it creates a wireless local area network (WLAN) for other devices such as mobile phones, laptops etc.
Repeater	It repeats signal from a wireless router or wireless access point and rebroadcasts the signal to other wireless devices.
Router	It provides access to the Internet or a private wireless computer network (WLAN).

Bridge Mode (Station - Secondary Site)

- i. Change the IP address and subnet mask if required then click **Next** to continue.

Application 1 - Network Extender using Bridge Mode

In this example, one device works in AP (Access Point) mode and another one works in Bridge mode (Client).

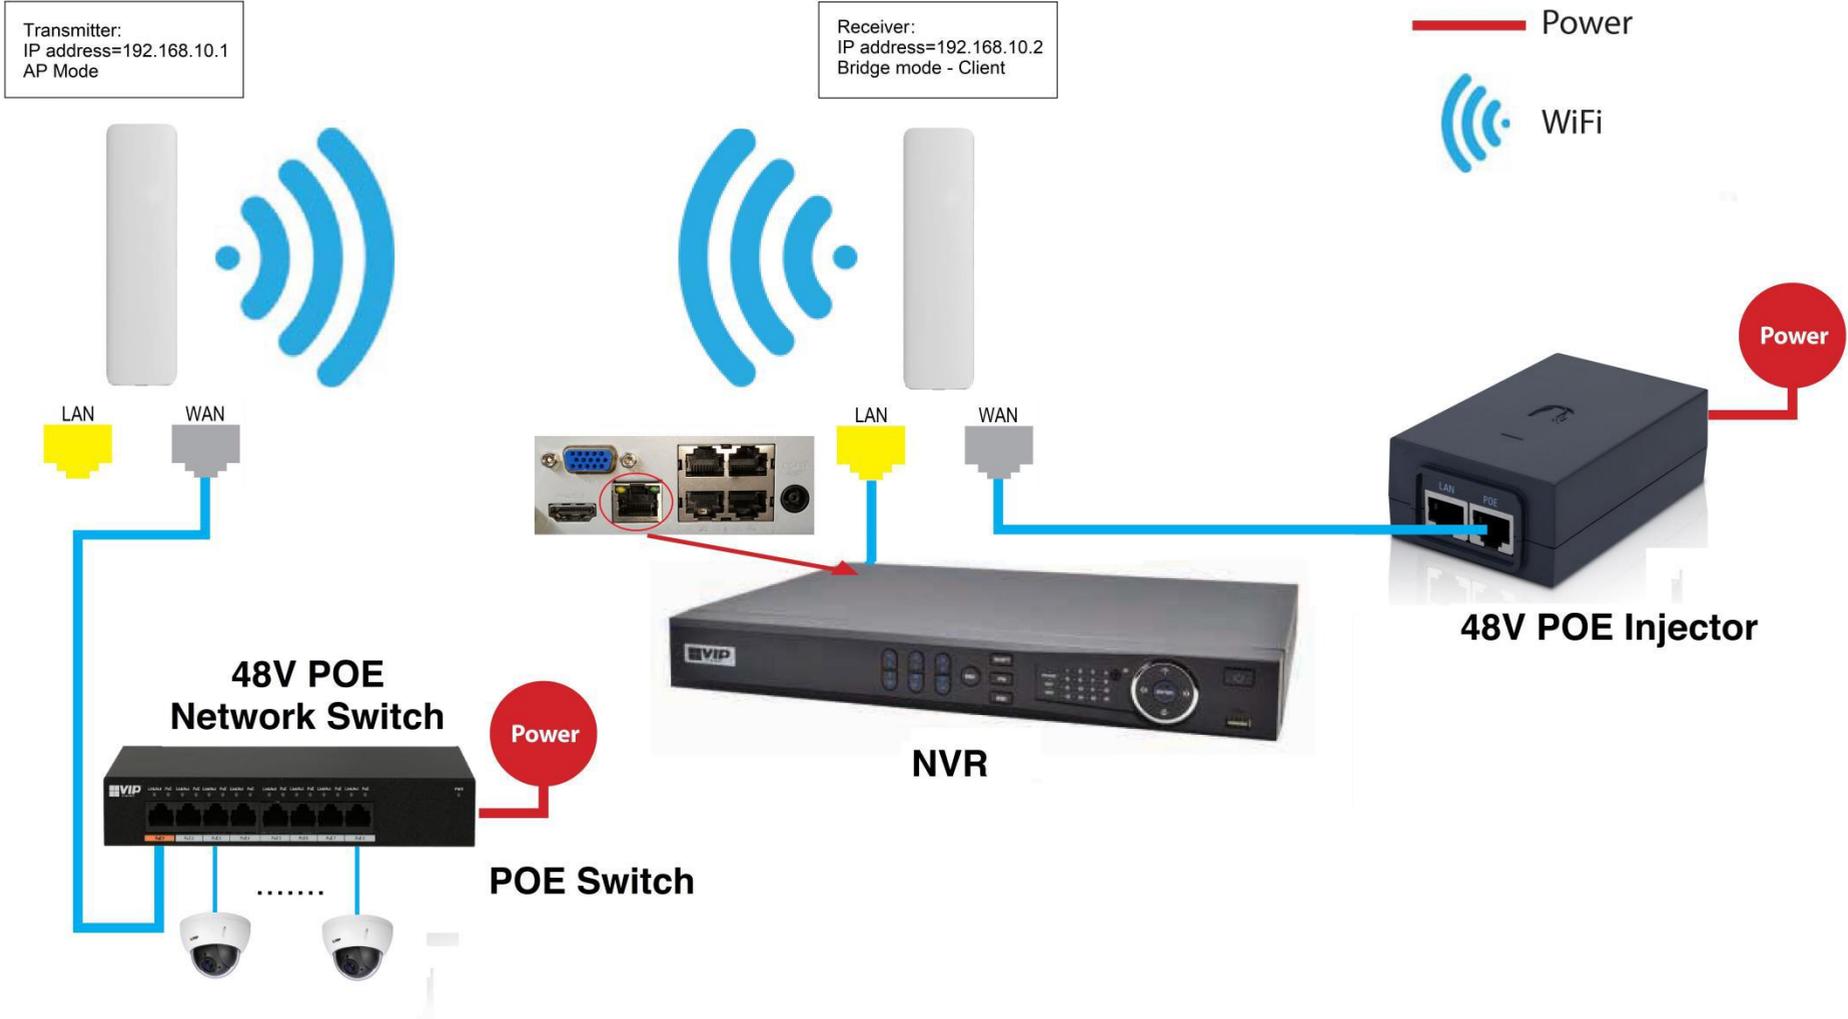

Note: Must use different IP address for the AP (Access Point) and Bridge client.

Application 2 - Network Video Recorder + Camera

Quick connection diagram

Installation Considerations

Mounting Height: For optimum performance, make sure a clear line of sight between the transmitter and receiver. An elevated location is recommended. Obstacles like trees, buildings and large steel structures will weaken the wireless signal.

Orientation: Make sure the transmitter and receiver is installed face-to-face to achieve maximum performance.

FAQs

Q: Do I need a power supply for the transmitter/receiver?

A: No, you don't. The transmitter/receiver is powered by 48V POE. Use a CAT5e/CAT6 cable, connect the WAN port to a 48V POE network switch or a 48V POE injector supplied. Connect the LAN port to the network device.

Q: How to reset the device?

A: Press and hold the RESET button for 5 seconds when power is on.

Q: I configured the AP as network bridge. How can I test the connection?

A: You can ping both the transmitter and receiver.

For example, if the transmitter address is 192.168.10.1 and those of receiver is 192.168.10.2:

- i. Change the IP address of the PC to 192.168.10.xx where xx=3 to 255. Change the subnet mask to 255.255.255.0
- ii. Ping the receiver side first (because the receiver is connected to the PC):
In Command mode, type: **ping 192.168.10.2 <ENTER>**
If the connection is successful, it will reply as follow:

```
Pinging 192.168.10.2 with 32 bytes of data:  
Reply from 192.168.10.2: bytes=32 time<1ms TTL=64  
Reply from 192.168.10.2: bytes=32 time=1ms TTL=64  
Reply from 192.168.10.2: bytes=32 time<1ms TTL=64  
Reply from 192.168.10.2: bytes=32 time<1ms TTL=64
```

```
Ping statistics for 192.168.10.2:  
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),  
Approximate round trip times in milli-seconds:  
Minimum = 0ms, Maximum = 1ms, Average = 0ms
```

Note: Make sure 0% loss as the receiver is connected to the PC direct, it should get 100% hit rate (0% loss).

The connection between the PC and the receiver is established.

Now test the connection between the transmitter and receiver:

- iii. In Command mode, type: **ping 192.168.10.1 <ENTER>**
If the connection is successful, it will reply as follow:

```
Pinging 192.168.10.1 with 32 bytes of data:  
Reply from 192.168.10.1: bytes=32 time<1ms TTL=64  
Reply from 192.168.10.1: bytes=32 time=1ms TTL=64  
Reply from 192.168.10.1: bytes=32 time<1ms TTL=64  
Reply from 192.168.10.1: bytes=32 time<1ms TTL=64
```

```
Ping statistics for 192.168.10.1:  
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),  
Approximate round trip times in milli-seconds:  
Minimum = 0ms, Maximum = 1ms, Average = 0ms
```

Note: The ideal case is to have 100% hit rate (0% loss). If not, adjust the CPE's orientation, height and distance to achieve the best performance.

You can also test the connection continuously by typing: **ping 192.168.10.1 -t <ENTER>**

Press **Ctrl-C** to stop testing.

Type **exit** to return to Windows platform.

Q: What is the default password for the web interface?

A: The default password is "**admin**".

Q: Web browser displays incorrectly.

A: Clear the cache and cookies data of the browser. Close the browser and open again.
