

# Technical Bulletin

## NEGNEG- Convert low current negative output to high current negative output.

### Purpose:

This document is primarily intended to provide technical support for system installers and integrators.

### Detail:

The NEGNEG is a very simple device designed to boost the negative output of an alarm [typically 150mA max] to a much higher current [8Amps Max for short time - pulsed] to drive higher powered devices.

### Wiring:

- Connect **RED** wire to Constant +12v power
- Connect **Black** wire to Ground or negative
- Connect **Purple** wire to the neg output of the alarm
- Connect **Orange** wire to high current load. **Note: Max 8 amps pulsed output only. The device is not rated for continuous load.**
